

Solution 1: encapsulate and export the **namespace**

```
let $ = (function() {  
    "use strict";  
  
    let module = {};  
  
    let private = function() {  
        // private is not available from outside  
    }  
  
    module.public = function() {  
        // public is available from outside  
    }  
  
    return module;  
} ());
```

Solution 2: Javascript module (new in es6)

➡ provides encapsulation and namespace by default

index.html

```
<script type="module" src="file1.mjs">
```

file1.mjs

```
export doSomething = function() {
```

```
}
```

file2.mjs

```
import { doSomething } from /file1.mjs
```
