

The problem with Javascript interpreters

- ✓ **Good Javascript** is interpreted by browsers in a consistent way
- ⦿ **Bad javascript** code is loosely interpreted by browsers in an inconsistent way

Solution 1: using **strict mode**

- ➡ Force the browser to validate Javascript against the standard
- ✓ Dynamically raises errors (or warnings) in the console when the code is not compliant with the standard

```
"use strict";
```

```
let doSomething = function() {  
    // this runs in strict mode  
}
```
