[old way] encapsulate and export the namespace

```
let $ = (function() {
    "use strict";
    let module = {};
    let private = function() {
         // private is not available from outside
    module.public = function() {
         // public is available from outside
    return module;
}());
```

[old way] Loading Javascript

Legend HTML parsing HTML parsing paused Script download Script execution <script> Let's start by defining what <script> without any attributes does. The HTML file will be parsed until the script file is hit, at that point parsing will stop and a request will be made to fetch the file (if it's external). The script will then be executed before parsing is resumed. <script async> async downloads the file during HTML parsing and will pause the HTML parser to execute it when it has finished downloading.

<script defer>

defer downloads the file during HTML parsing and will only execute it after the parser has completed. **defer** scripts are also guaranteed to execute in the order that they appear in the document.
