Solution I : encapsulate Javascript in a closure

```
(function() {
    "use strict";

let private = function() {
        // private is not available from outside
    }
}());
```

Solution I: encapsulate and export the namespace

```
let $ = (function() {
    "use strict";
    let module = {};
    let private = function() {
         // private is not available from outside
    module.public = function() {
         // public is available from outside
    return module;
}());
```
