Basic Authentication (stateless)

(Standard) RFC 2617

- → Login and password are sent in **clear**(Base64 encoding) in **the headers** "authorization"
 - \$ curl -u login:password http://url
 - \$ curl http://admin:password@url

Session Authentication (stateful)

(Standard) RFC 6265

- I. The user enters a login and password and the frontend send them to the backend (POST request)
- 2. The backend verifies the login/password based on information stored on the server (usually in the database)
- 3. The backend stores user information in a session
- 4. The backend grants access to resources based on the information contained in the session
