## Why having separated servers?

Each piece of our three-tiered architecture relies on specific OS configurations, libraries and runtime environment

- These environments might conflict with each other
- → Having several servers enable to isolate them
- ✓ Easier to maintain and more reliable
- But having several servers has a cost!
- → Use virtual servers (or containerized servers)
- ✓ Cost effective and even simpler to maintain (and to scale, coming later)

## Dockerized three-tiered architecture
