CSCC09	Last Name:	
Spring 2021	Student Number:	
Final Exam		@mail.utoronto.ca

Do not turn this page until you have received the signal to start.

In the meantime, fill out the identification section above and read the instructions below carefully.

This 3 hours exam contains 22 pages (including this cover page) and 6 parts. Check to see if any pages are missing. Enter all requested information on the top of this page, and put your initials on the top of every page, in case the pages become separated.

You may **not** use notes, or any calculator on this exam.

There are several types of questions identified throughout the exam by their logos:

✓ 1	select the best answer only among multiple choices.
✓ ★	select all correct answers (and those ones only) among multiple choices. At least one applies.
my answer	fill the blanks with a short answer (less than 5 words).
•—•	connect each item from the left side to one (and one only) item from the right side. A right side item might be connected to several left side items. The right side and the left side might not necessarily have the same number of items.

For each question, the following rules apply:

- There is no partial credit (unless stated otherwise). This means that, for a given question, you either receive the full mark allocated if all answers are correct or 0 if there is any mistake.
- Your answer should be clear. Your answer to a question might be considered as incorrect
 if there is:
 - any part of the answer that cannot be read
 - any part of the answer that cannot be associated with its corresponding question part

Do not write anything in the table below.

Part:	1	2	3	4	5	6	Total
Points:	20	20	20	20	20	8	108
Score:							

1. Part 1

(1.1) 3 points - \bullet — \bullet

Match each technology with its concept:

HTML • Presentation

CSS • Processing

Javascript • Content

```
HTML •—• Content

CSS •—• Presentation

Javascript •—• Processing
```

(1.2) 5 points - my answer

Complete the HTML (by filling-in with the appropriate attributes) and CSS (by filling-in with the appropriate accessors) so that:

- The first span is the unique element in the entire DOM that has a blue background
- The first and second span elements have a 2px red solid border around each of them
- The third span element has no border and no background set

```
(1.3) 1 point - \checkmark_1
```

By mistake, a frontend developper has copy-pasted the same piece of Javascript twice in the source code (as shown below). How many times is the word hello printed on the console when elmnt is clicked:

```
elmnt.onClick = function(event) {
    console.log("hello");
};
elmnt.onClick = function(event) {
    console.log("hello");
};
```

- \bigcirc 0
- $\sqrt{1}$
- \bigcirc 2
- \bigcirc more than 2

(1.4) 1 point - \checkmark_1

By mistake, a frontend developper has copy-pasted the same piece of Javascript twice in the source code (as shown below). How many times is the word hello printed on the console when elmnt is clicked:

```
elmnt.addEventListener('click', function(event) {
    console.log("hello");
});
elmnt.addEventListener('click', function(event) {
    console.log("hello");
});
```

- \bigcirc 0
- \bigcirc 1
- $\sqrt{2}$
- \bigcirc more than 2

(1.5)	1 point - \checkmark_1		
	The Document Object Model is		
	○ an API for storing structured data le	ocally (in the brow	vser)
	○ a way to structure NoSQL databases	5	
	$\sqrt{}$ the tree structure of a web page		
	○ an API to access the browser configu	ıration	
(1.6)	2 points - my answer		
	An HTTP server runs behind the port	80	by default whereas
	an HTTPS server runs behind the port	443	by default.
	In which part of the HTTP request message are Each answers is either in the headers or in the the login and password (using basic authors) the content type (a.k.a body encoding) is the cookies are stored in the headers the cookies are stored in the headers	ne body . Intication) are stored in the	red in the <u>headers</u>
	• the user's preferred locales (a.k.a accepted	languages) are sto	red in the <u>headers</u>
	• the content of uploaded files is stored in the	he <u>body</u>	-
(1.8)	1 point - \checkmark_1		
	HTTP/2 allows		
	the backend to bundle javascript as HTTP response	nd CSS files into	one file sent back as an
	the frontend to request multiple reso	ources with a singl	e HTTP request
	\bigcirc the frontend and the backend to con	npress HTTP requ	ests and responses
	$\sqrt{}$ the backend to reply to a single HT	ΓP request with m	nultiple HTTP responses

2.	Par	t :	2
((2.1)	2	po

oints - ✓★ Which HTTP methods are safe (i.e should not have any side effect): \square POST $\square \ \operatorname{PUT}$ $\sqrt{\text{GET}}$ $\ \square \ \ PATCH$ \Box DELETE (2.2) 1 point - \checkmark ₁ When I enter the URL c09rocks.com in my browser, the browser sends an HTTP request with the method: O POST O PUT

 $\sqrt{\text{GET}}$ ○ PATCH ○ DELETE

(2.3) 2 points - \checkmark_{\bigstar}

Which methods are used when retrieving images, scripts and stylesheets:

 \square POST

 $\ \square \ \operatorname{PUT}$

 $\sqrt{\text{GET}}$

 \square PATCH

 \square DELETE

(2.4) 8 points - <u>my answer</u> (or 4 points for one up to three wrong answers)	
Assuming that the browser sends an HTTP request to the server to access some use	r's
profile information. For each scenario, fill-in the blanks with the appropriate error co	de
family that the server should returned. Each answer is either $1xx$, $2xx$, $3xx$, $4xx$ and 5	XX
(the last two digits are not important and will be ignored).	
\bullet when the database has crashed and the user's profile cannot be a	re-
trieved	
\bullet when the user's profil is returned (JSON content type)	
\bullet when the user's profil is returned (HTML content type)	
\bullet <u>4xx</u> when the request is not authenticated to access the user's profile	
• when the request is authenticated but not authorized to access the	at
user's profile	
• when the user's profile URL has changed and the server automatical	lly
redirects the browser to another URL	
\bullet when the user's ID is not in the database	
• 4xx when the user's ID is ill-formed (invalid format)	
(2.5) 1 point - \checkmark_1	
JSON is	
\bigcirc a way to structure a NoSQL database	
a way to represent structured data as strings	
\bigcirc a special HTTP request to send structured data to the server	
○ a specific javascript data structure	
(2.6) 1 point - \checkmark_1	
JSON data can be manipulated with Javascript only:	
\bigcirc true	
$\sqrt{ m false}$	

(2.7)	1 point $-\checkmark_1$
	JSON is the only way to send structured data to the server:
	\bigcirc true
	$\sqrt{\ ext{false}}$
(2.8)	1 point $- \checkmark_1$
	When a login and password form is submitted to the backend $without\ using\ Ajax$, the data
	is by default encoded as:
	o application/json
	o application/json-form
	$\sqrt{\text{application/x-www-form-urlencoded}}$
	O multipart/form-data
(2.9)	1 point $-\checkmark_1$
	When uploading a file, the content-type of the request should be set to:
	o application/json
	o application/x-www-form-urlencoded
	$\sqrt{\text{multipart/form-data}}$
	○ the file mimetype
(2.10)	1 point $-\checkmark_1$
	When downloading a file, the content-type of the response should be set to:
	o application/json
	o application/x-www-form-urlencoded
	O multipart/form-data
	$\sqrt{}$ the file mimetype
(2.11)	1 point $-\checkmark_1$
	Files can be uploaded using Ajax:
	$\sqrt{\text{true}}$
	○ false

3.	P	art	3

(3.1)	7 points - <u>my answer</u> (or 3 points for one up to three wrong answers)
	Let's assume that the database stores a collection of items. Each item has a unique id and
	some attributes. Following the REST design principles, provide the HTTP method and
	the path for each assertion below (the first one is given):
	• Retrieve the item id=42: GET /items/42/
	• Delete all items:
	• Replace all items with new ones: PUT /items/
	• Create a new item given its id=42: PUT /items/42/
	• Retrieve all items (no pagination):GET /items/
	• Delete the item id=42:
	• Create a new item without specifying its id: POST /items/
	• Replace some attributes for the item id=42: PATCH /items/42/
(3.2)	2 points - <u>my answer</u> Let's assume that the database stores a collection of user's
	profiles. We are not allowed to retrieve all users from the database but we are allowed to re-
	trieve all users that have the same given last name. Following the REST principle, complete
	the following query string to get all users named Sans: GET /users/?lastname=Sans
(3.3)	2 points - ✓★
	A piece of javascript code executed on the frontend (browser) can
	$\sqrt{\text{ modify a local storage key/value pair}}$
	modify an unprotected cookie key/value pair
	□ modify a session key/value pair
(3.4)	2 points - ✓★
	A piece of javascript code executed on the backend (node.js) can
	$\hfill\Box$ modify a local storage key/value pair
	$\sqrt{\text{ modify a cookie key/value pair}}$
	$\sqrt{\text{ modify a session key/value pair}}$

(3.5)	1 point $-\checkmark_1$
	Assuming that the client has been authenticated (stateful authentication), what happens
	if the client tries to access to a protected resource without sending back the session Π
	cookie to the server:
	O the server recovers the session from the database, recreates the session ID cookie
	and grants access to the ressource
	O the server generates a new session, recreates the session ID cookie and grants
	access to the ressource
	the server denies access to the ressource
(3.6)	2 points - ✓★
	Using stateful authentication
	$\sqrt{}$ the same user can be authenticated on two different computers at the same time
	$\sqrt{\ }$ the same user can be authenticated on the same computer using two different
	browsers at the same time
	$\hfill\Box$ two users can be authenticated on the same browser at the same time
	$\sqrt{\ }$ two users can be authenticated on the same computer using two different browser
	at the same time
(3.7)	4 points - ✓★ and my answer
	A web application ${\bf A}$ uses a third-party authentication (OAuth) service from ${\bf B}$ to authentication
	ticate a client ${\bf C}$. Considering the options below, check the ones that are part the OAuth
	scheme and leave the others unchecked. For all options that you checked (and only those
	ones), fill the blanks with either: \mathbf{A} , \mathbf{B} or \mathbf{C} .
	$\sqrt{}$ sends the login and password to $\underline{}$ B
	\Box the latter forwards the login/password to
	the latter verifies the login/password and returns a token toC
	the latter forwards the token to $$

 $\sqrt{}$ the latter ask $\underline{}$ b to verifies the token and return the user's profile

4. Part 4

(4.1) 1 point - \checkmark_1

What is the purpose of in the xhr.withCredentials instruction in the javascript code below?

```
function request(method, url, type, content, callback){
    window.onload = function(e){
        var xhr = new XMLHttpRequest();
        xhr.onload = callback
        xhr.open(method, url, true);
        xhr.setRequestHeader('Content-Type', type);
        xhr.withCredentials = true;
        xhr.send(JSON.stringify({content: content}));
}
```

- osend login and password over Ajax using the basic authentication method
- $\sqrt{\ }$ send the authentication cookie with cross-origin Ajax requests
- O enable the secure cookie flag for the authentication cookie before sending it over through Ajax
- O this instruction does not exist actually

$(4.2) 1 \text{ point } - \checkmark_1$

When visiting a specific webpage, the browser says that "the website has a non trusted certificate", it means that

- $\sqrt{\ }$ the certificate is not signed by a certificate authority known by my browser
- () the browser does not know the private key associated with the certificate
- the certificate is not signed by the server hosting the website
- the browser does not recognized the certificate because it is the first time I am visiting this website

(4.3) 1 point - \searrow	/ :
------------------------------	------------

Mixed-content occurs when

- $\sqrt{}$ the client retrieves HTTP and HTTPS content from the same domain
- () the server sets the wrong content-type header
- () the server does no correctly sanitize users inputs
- () the client retrieves a malicious script

(4.4) 3 points - \bullet — \bullet

Match each cookie flag with the type of attack it tries to mitigate (but not necessarily prevent)

- httpOnly •
- prevents the cookie from being read or writen by frontend javascript
- secure •
- prevents the cookie from being sent over HTTP
- sameOrigin •
- prevents the cookie from being sent sent over cross-domain requests

httpOnly •—• prevents the cookie from being read or write by frontend javascript

secureFlag •─• prevents the cookie from being sent over HTTP

sameOrigin •—• prevents the cookie from being sent sent over cross-domain requests

$(4.5) 1 \text{ point } - \checkmark_1$

I18N (Internationalization) is the process of developing a software that

- $\sqrt{}$ is language agnostic
- is automatically adapted for a specific language using a translation API
- is specifically adapted for a specific language using a locale

$(4.6) 1 \text{ point } - \checkmark_1$

L10N (Localization) is the process of developing a software that

- () is language agnostic
- is automatically adapted for a specific language using a translation API
- $\sqrt{\ }$ is specifically adapted for a specific language using a locale

(4.7) 2 points - \checkmark

Assuming that the browser loads a webpage from \mathbf{A} that contains a piece of javascript code. Without considering any cross-sharing HTTP request, what resources from another domain \mathbf{B} can be loaded by this piece of code without violating the same origin-policy:

```
√ a script using the SCRIPT tag
√ a stylesheet using the LINK tag
□ a script using an Ajax request
□ some JSON data using an Ajax request
√ an image using the IMG tag
√ a piece of HTML using the IFRAME tag
```

(4.8) 1 point - \checkmark_1

Assuming that the browser loads a webpage from A that contains a piece of javascript code that performs a cross-origin Ajax request to B. What happens if the same-origin policy is violated?

- \bigcirc the client's browser blocks the HTTP request going from the client to ${\bf B}$
- \bigcirc **A** blocks the HTTP request going from the client to **B**
- () A blocks the HTTP response coming from B back to the client
- $\sqrt{}$ the client's browser blocks the HTTP response coming from **B** back to the client
- O B blocks the HTTP request coming from the client

(4.9) 2 points - \checkmark

Assuming that the browser loads a webpage from A that contains a piece of javascript code that performs a cross-origin Ajax request to B. How to enable the Cross-Origin Ressource Sharing (CORS)?

- $\hfill\Box$ the client's browser sets the Access-Control-Allow-Origin header in the HTTP request going to ${\bf A}$
- $\hfill\Box$ the client's browser sets the Access-Control-Allow-Origin header in the HTTP request going to ${\bf B}$

	\square A sets the Access-Control-Allow-Origin header in the HTTP response going
	back to the client
	$\sqrt{~{f B}}$ sets the Access-Control-Allow-Origin header in the HTTP response going
	back to the client
(4.10)	1 point - \checkmark_1
	What is the purpose of setting up the Access-Control-Allow-Credentials header to
	true in the HTTP response of a cross origin request?
	\bigcirc to allow the browser to send the authentication cookie with the next cross-origin
	request
	to allow the browser to expose the response to frontend JavaScript code when
	the authentication cookie was included in the cross-origin request
	\bigcirc to set the sameOrigin cookie flags in the response to the cross-origin request to
	protect the authentication cookie
	○ this header does not exist
(4.11)	1 point - \checkmark_1
	To own the domain c09rocks.com, one should ask
	a domain name registrar
	an internet service provider
	○ a certificate authority
	the server that hosts the website
(4.12)	1 point $-\checkmark_1$
	Memcached is
	○ a technique to shadow the web server's memory in case of a crash
	○ a library for optimizing raw database requests
	on operation that pushes memory overflow to the database
	a distributed shared cache library for dynamic content

(4.13) 1 point - \checkmark_1				
A load balancer				
○ restructures a database dynamically and improve its efficiency				
takes incoming HTTP requests and spread them across multiple web servers				
internally				
\bigcirc synchronizes the databases between different web servers				
\bigcirc routes the traffic to different web servers at the DNS level				
$(4.14) 1 \text{ point } - \checkmark_1$				
A CDN is				
○ restructures a database dynamically and improve its efficiency				
○ takes incoming HTTP requests and spread them across multiple web servers				
internally				
\bigcirc synchronizes the databases between different web servers				
routes the traffic to different web servers at the DNS level				
(4.15) 2 points - \checkmark_{\bigstar}				
Web analytics can be done:				
on the browser side				
on the server side				

5. **Part 5**

```
function foo(){
    Array.from({length: 1000000}, () => Math.random()).sort();
}
console.log('a')
setTimeout(function(){
    console.info('b');
}, 2000);
console.log('c')
foo();
console.log('d');
```

In this program, we can assume that the function foo takes roughly 6 sec to execute.

(5.1) 2 points - \checkmark_1 and my answer

Can you deterministically predict in which order the messages a, b, c, and d will be printed on the console, based on your understanding of Javascript non-blocking I/O and its event-loop execution model?

- O no, we cannot predict the order (non deterministic execution)
- $\sqrt{}$ yes, we can predict the order: 1. <u>a</u>, 2. <u>c</u> 3. <u>d</u> and 4. <u>b</u>

(5.2) 2 points - \checkmark ₁ and my answer

- O no, we cannot predict the time
- $\sqrt{\text{yes}}$, we can predict that it will take <u>6</u> sec (+/-1 sec)

```
setTimeout(function(){
    console.info('a');
}, 9000);
console.log('b')
setTimeout(function(){
    console.info('c');
}, 4000);
console.log('d');
```

(5.3) 2 points - \checkmark ₁ and my answer

Can you deterministically predict in which order the messages a, b, c and d will be printed on the console based on your understanding of Javascript non-blocking I/O and its event-loop execution model?

- no, we cannot predict the order (non deterministic execution) $\sqrt{}$ yes, we can predict the order: 1. __b__, 2. __d__ 3. __c__ and 4. __a__
- (5.4) 2 points \checkmark ₁ and **my answer**

- O no, we cannot predict the time
- $\sqrt{\text{yes}}$, we can predict that it will take $9 \sec (+/-1 \sec)$

```
function timer(time, msg){
    return new Promise(function(resolve, reject){
        setTimeout(function(){
            console.log(msg);
            resolve();
        }, time);
    });
}
timer(9000, 'a').then(function(){
    timer(4000, 'b').then(function(){
        console.log('c');
    })
});
console.log('d');
```

(5.5) 2 points - \checkmark ₁ and my answer

Can you deterministically predict in which order the messages a, b, c and d will be printed on the console based on your understanding of Javascript non-blocking I/O and its event-loop execution model?

- \bigcirc no, we cannot predict the order (non deterministic execution) \bigvee yes, we can predict the order: 1. \underline{d} , 2. \underline{a} 3. \underline{b} and 4. \underline{c}
- (5.6) 2 points \checkmark_1 and my answer

- O no, we cannot predict the time
- $\sqrt{\text{yes}}$, we can predict that it will take <u>13</u> sec (+/-1 sec)

```
function timer(time, msg){
    return new Promise(function(resolve, reject){
        setTimeout(function(){
            console.log(msg);
            resolve();
        }, time);
    });
}
Promise.all([timer(9000, 'a'), timer(4000,'b')]).then(function(){
        console.log('c');
});
console.log('d');
```

(5.7) 2 points - \checkmark_1 and my answer

Can you deterministically predict in which order the messages a, b, c and d will be printed on the console based on your understanding of Javascript non-blocking I/O and its event-loop execution model?

- O no, we cannot predict the order (non deterministic execution)
- $\sqrt{}$ yes, we can predict the order: 1. <u>d</u>, 2. <u>b</u> 3. <u>a</u> and 4. <u>c</u>

(5.8) 2 points - \checkmark ₁ and my answer

- O no, we cannot predict the time
- $\sqrt{\text{yes}}$, we can predict that it will take $9 \sec (+/-1 \sec)$

```
function timer(time, msg){
    return new Promise(function(resolve, reject){
        setTimeout(function(){
            console.log(msg);
            resolve();
        }, time);
    });
}
async function run() {
    await timer(9000, 'a');
    await timer(4000,'b');
    console.log('c');
};
run();
console.log('d');
```

(5.9) 2 points - \checkmark ₁ and my answer

Can you deterministically predict in which order the messages a, b, c and d will be printed on the console based on your understanding of Javascript non-blocking I/O and its event-loop execution model?

○ no, we cannot predict the order (non deterministic execution)
√ yes, we can predict the order: 1. __a__, 2. __b__ 3. __c__ and 4. __d__

(5.10) 2 points - \checkmark ₁ and my answer

Analyzing the program above, can you deterministically estimate how long it will take for the program to terminate?

○ no, we cannot predict the time $\sqrt{\text{yes}}$, we can predict that it will take $\boxed{13}$ sec (+/-1 sec)

6. Bor	nus	
	There are no bad answers to the questions below. You will get points if	the instructor
	believes you genuinely made some efforts to provide an answer. Keep in mind	that quantity
	does not beat quality.	
(6.1)	2 points - my answer	
	What are the topics that you did not know before taking this course and	l you enjoyed
	learning	
(6.2)	2 points - my answer	
	What are the topics related to web development that you would like to learn	and that was
	not covered in this course	
(6.3)	2 points - my answer	
	Would you recommend this course to other students?	

(6.4) 2 points - **my answer**
