Be careful of mixed content

Mixed-content happens when:

- I. an HTTPS page contains elements (ajax, js, image, video, css ...) served with HTTP
- 2. an HTTPS page transfers control to another HTTP page within the same domain
- authentication cookie will be sent over HTTP
- √ browsers provide a mix-content protection now

Secure cookie flag

- √ The cookie will be sent over HTTPS exclusively
- → Prevents authentication cookie from leaking in case of mixedcontent
