[old way] Scoping problem with strict mode

```
file1.js
"use strict";
let doSomething = function() {
    // strict mode applies
                                      file2.js
let doSomethingElse = function() {
    // strict mode applies too
```

[old way] Encapsulate Javascript in a closure

```
(function() {
    "use strict";

let private = function() {
        // private is not available from outside
    }
}());
```
