Express.js - Routing based on the path

src/express-examples/02_routing.js

```
// curl localhost:3000/
app.get('/', function (req, res, next) {
    res.end(req.path + ": the root")
});
// curl localhost:3000/messages/
app.get('/messages/', function (req, res, next) {
    res.end(req.path + ": get all messages")
});
// curl localhost:3000/messages/1234/
app.get('/messages/:id/', function (req, res, next) {
    res.end(req.path + ": get the message " + req.params.id)
});
```

Express.js - body encoding

The body of HTTP request and response is a string

- → **Problem:** how to send data structure between the frontend and backend?
- → Solution: encode them either using:
 - ✓ URI encoding (sometimes used) see src/express-examples/04_body-uri-encoded.js
 - ✓ XML encoding (rarely used these days)
 - ✓ JSON encoding (very frequently used these days)
 See src/express-examples/05_body-json-encoded.js
