Scoping problem with strict mode

```
--------------------------------------------
                                     file1.js
"use strict";
let doSomething = function() {
    // strict mode applies

}

--------------------------------------------
let doSomethingElse = function() {   file2.js
    // strict mode applies too

}
```

Solution : encapsulate Javascript in **a closure**

```javascript
(function() {
    "use strict";

    let private = function() {
        // private is not available from outside
    }
}());
```
