The problem with Javascript interpreters

✓ **Good Javascript** is interpreted by browsers in a consistent way

◉ **Bad javascript** code is loosely interpreted by browsers in an inconsistent way

Solution 1: using **strict mode**

➡ Force the browser to validate Javascript against the standard

✓ Dynamically raises errors (or warnings) in the console when the code is not compliant with the standard

```
"use strict";
let doSomething = function() {
    // this runs in strict mode
}
```
