Scoping problem with strict mode

```
----------------------------------------
                                  file1.js
"use strict";
let doSomething = function() {
    // strict mode applies

}

----------------------------------------
let doSomethingElse = function() {   file2.js
    // strict mode applies too

}
```

Solution 1 : encapsulate Javascript in **a closure**

```javascript
(function() {
    "use strict";

    let private = function() {
        // private is not available from outside
    }
}());
```
